Creating Healthier and Safer Computing Environments for Healthcare Operations

As medical organizations push toward greater levels of automation and paperless office standards, PC's are becoming more and more prevalent in all aspects of operations. From the front desk, to accounting, to patient education and exam rooms, PC's – and keyboards – are omnipresent.

PC keyboards are hotspots for bacteria. PC keyboards harbor more than 3000 microbes per square inch – as compared to 49 per square inch on toilet seats. Yet most healthcare organizations do little or nothing to remedy the situation, leaving employees and patients alike susceptible to infection and illness.

The problem is a result of two things:

- Most people are unaware just how “dirty” keyboards are. Individuals are conditioned to wash their hands after using the bathroom, or to wash food preparation materials when handling raw meat, but the general population isn't educated about keyboard contamination. Recent research is changing that awareness.
- Keyboards typically aren't conducive to cleaning. Most people consider running fluids across the surface of their keyboards as dangerous – that liquid may “short out” their computer. As a result, bacteria is left to breed on keyboards. Even so-called “spill-resistant” keyboards are limited in their protection against fluids.

Washable keyboards from Decon are just that: washable. More than just a damp cloth across the surface of the keys, Decon keyboards can withstand being sprayed and being run under a faucet. They are the first mass market PC keyboards certified washable to international IP66 and NEMA4X standards.

FEATURES:

Washable and easy to disinfect: Decon keyboards can be sprayed with a disinfectant and then rinsed thoroughly under running water.

Full-travel keyboard: Unlike washable keyboards with a one-piece design, Decon keyboards have standard action keys for the touch response you expect.

Surprisingly affordable: Decon keyboards are a quarter of the cost of other sealed keyboard designs.

BENEFITS:

Expand your Infection Control Initiative: Fully disinfecting your keyboards can now be part of your initiative to reduce hospital acquired infections.

Standard feel keyboard: Give your doctors, employees and patients keyboards with the performance they expect.

Save money: Stretch your budget by buying smart.
